Problem 4. Type-Conversion Detective

Part A. Copy the table into your notebook. Predict the result of each expression first, then check it in Python.

Expression	**Your prediction**	**Python's answer**
int("7") + 3.5	10.5	10.5
str(10) * 3	101010	101010
bool(""), bool(" ")	I don’t know	False True
int(3.99)	3	3
float("1e3")	1.e3	1000.0
int(True) + float("2.5")	3.5	3.5
round(2.5), round(3.5)	3 4	2 4
type(10 / 2)	<class int>	<class ‘float’>
